ESD for EGC with Uncommon Histology

Soo-Jeong Cho, M.D., Ph.D.
Center for Gastric Cancer, National Cancer Center, Goyang, Korea

Age and Gender: 76 years old, male

Chief Complains: Consultation for a polypoid lesion during esophagastroduodenoscopy

Present Illness: He was referred to our hospital due to a suspicious malignant lesion of the stomach that was detected during a medical check-up at a primary clinic. Esophagastroduodenoscopy (EGD) revealed a polypoid mucosal lesion, which was diagnosed as EGC. He had no gastrointestinal symptoms and no prior history of abdominal surgery.

Past history: EMR for early gastric cancer (7YA)

Family history: None

Medication History: Anti-hypertensive medication

Physical Examination and Laboratory Findings:
Unremarkable in physical examination
CBC: 7,820/mm$^3$ - 13.5 g/dL - 198,000/mm$^3$

Endoscopic and Radiologic Findings:
EGD: a 1.8 cm sized polypoid lesion at the posterior wall side of low body
Abdominal computer tomography: unremarkable

Hospital Progress: The patient received endoscopic procedure.
